

Spin into clean filtration-silently

BTI's New SpinFlow Filter System

It's unlike any pneumatic trailer air filter on the market.

The new B.T.I.

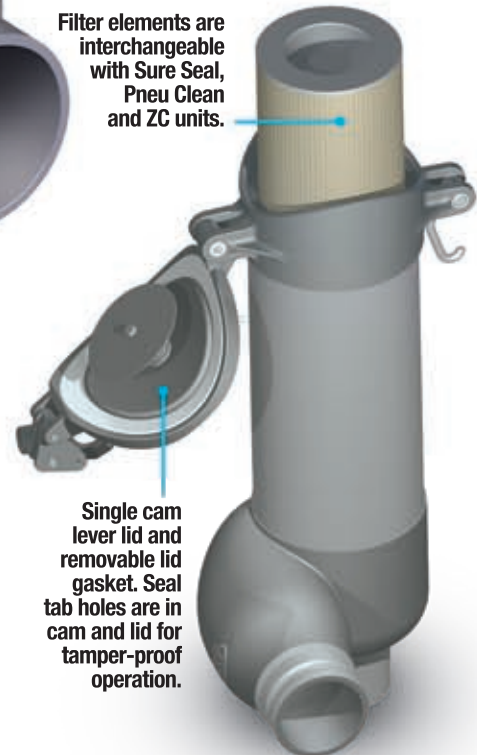

SpinFlow Filter System has a silencer built into the air inlet casting of the unit. The unique design of the air inlet chamber casting performs as a silencing and dampening system. This chamber reduces blower noise compared to existing systems on the market today. As air enters the filtration system, this unique design reduces back pressure, which equals a reduction in heat build up.

The silencer is built in at no additional cost to you!

The unit starts to spin the air as it enters the air inlet. The air is directed up the housing, utilizing the complete filter element smoothly and evenly with less back pressure and pressure drop, saving you money by making your elements last longer than any unit on the market.

The SpinFlow assembly uses a single cam lever lid, which requires fewer parts and fewer adjustments. The lid gasket is easily removable for cleaning purposes. Seal tab holes are in the cam and lid for tamper-proof operation.

Filter elements are interchangeable with Sure Seal, Pneu Clean and ZC units.

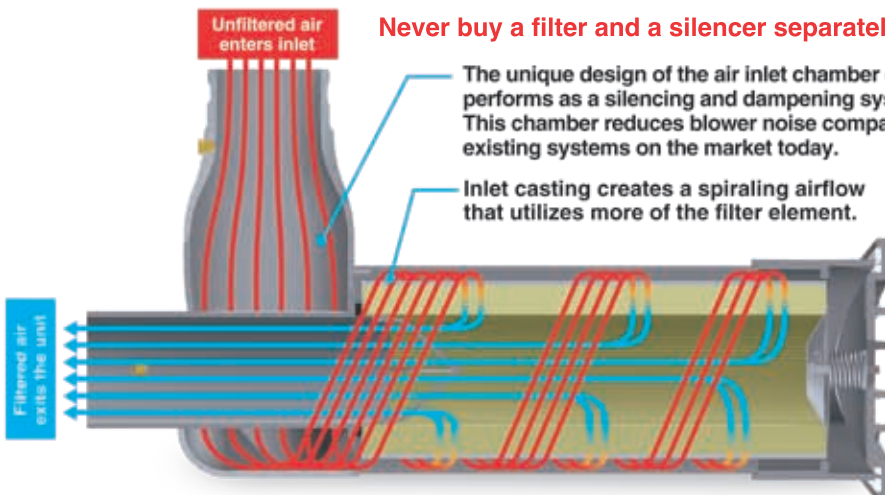

Single cam lever lid and removable lid gasket. Seal tab holes are in cam and lid for tamper-proof operation.

Never buy a filter and a silencer separately again!

The unique design of the air inlet chamber casting performs as a silencing and dampening system. This chamber reduces blower noise compared to existing systems on the market today.

Inlet casting creates a spiraling airflow that utilizes more of the filter element.
