BTI adds a new type of manhole lever adjuster to its product offering

BTI of Park Hills, Missouri, announced today the addition of a new kind of adjuster for manhole lever applications. The Never-Seize adjuster is advertised to do just that; never seize due to contamination or product build-up.

According to company engineers, the Never-Seize adjuster solves an industry problem that has been overlooked for years.

“We took a fresh look at it,” stated Andy Boyer, BTI President. “We recognized that the industry didn’t realize how much time and money was being spent replacing the old style manhole adjusters. Now there’s a choice, a state-of-the-art and easily adjustable version,” concluded Boyer.

According to BTI, the Never-Seize adjuster will be available in Stainless Steel, High-Strength Carbon Steel with Nickel Coating, or for the ultimate in product build-up resistance, a special proprietary coating material infused into High-Strength Carbon Steel. The adjuster features internal adjustment threads with an o-ring seal and a built-in scraper to remove product build-up.

BTI officials had an independent laboratory certify that the unique design of the BTI Never-Seize Manhole Adjuster is stronger than industry standards and up to 35% lighter, saving up to 10 lbs. per trailer.

100% American-made, the BTI Never-Seize Manhole Adjuster will be available for shipment first quarter of 2020.

“This is another exciting example of BTI’s innovative product design, and as with all our products, we unconditionally guarantee this product will outperform any similar product on the market today,” stated Boyer.
