**BTI's new EasyAccess™ Multi-Angle Neck Extension allows for easy access of butterfly valves.**

*Park Hills, Missouri, November 21, 2012*— Bulk Tank Inc. (BTI) unveiled their new EasyAccess™ Multi-Angle Neck Extension at the NTTC show October 23<sup>rd</sup>. As the name implies, the extension provides “easy access” to open or close a butterfly valve on a pneumatic tank trailer. According to company officials, the new product received great reviews from the crowd at NTTC.

“With EasyAccess™ there’s no more crawling under tank trailers in messy situations; no more back injuries and workman compensation claims due to awkward angles and burns from air supply lines that can reach 350°F.” said Dave Sisk, president of BTI. “Because of the unique design of EasyAccess™, this multi-angle extension can be made to fit any situation. The stem can be angled from 0° to 45° with just a slight increase in operating torque to open and close the valve,” Sisk added.

BTI’s engineers provided the following features and benefits:

- The EasyAccess™ Multi-Angle Neck Extension consists of a universal joint fastened to the stem of the butterfly valve.
- A rubber boot over the u-joint seals contamination out of the joint and retains lubrication. The other half of the u-joint is securely fastened to the top stem. The unit is supported at the top with a short section of BTI’s neck extension extrusion.
- Two bushings support the shaft in the extrusion, and two o-rings seal the extrusion from contamination and provide a lubrication chamber, with a grease fitting for easy maintenance and years of trouble-free operation.

EasyAccess™ is available in any length specified and is 100% American made. The extension will be an available option on BTI’s BlackMaxx™, MaxxLife™ and Utility butterfly valve lines.
