

FOR IMMEDIATE RELEASE

B.T.I.'s New Easy Open Hopper Tee Costs Less, Delivers More

New Model is Faster, Lighter, More Efficient

Park Hills, Missouri, April 1, 2009—It's not every day that a company manages to make a good product even faster, lighter, and more efficient while lowering the cost. But Bulk Tank Inc. (B.T.I.), headquartered in Park Hills, Missouri, has done just that with their new Easy Open Hopper Tee.

B.T.I. has added a feature to the Easy Open Hopper Tee that allows for cleaning without completely unlatching the tee assembly from the flange. Fast and simple cleaning of the Easy Open Hopper Tee eliminates the danger of cross-contamination in just three simple steps: 1) Insert the cam handle and rotate upward 2) Remove the cam handle and remove the butterfly valve or install it in the hooked position 3) Unlatch the tee and swing it completely out for easy cleaning and maintenance.

The Easy Open Hopper Tee utilizes B.T.I.'s patented SiphonFlow™ technology that incorporates two pressure forces instead of just one. As product is pushed out with tank pressure, the SiphonFlow™ technology creates a venturi effect which simultaneously pulls product through, drastically reducing unload time. The New Easy Open Hopper Tee is also easier to install and adjust with only two easy adjustment points instead of earlier designs on the market that must be adjusted at four points. The unique design is approximately 20% lighter than similar tees on the market with polymer and oil impregnated bronze brushings in all pivot points for years of trouble-free operation. All of these elements combine to eliminate much of the frustration of previous models while enhancing productivity and guaranteeing a long service life. In fact, Bulk Tank, Inc. unconditionally guarantees this product will outperform any other hopper tee product on the market today.
