

BTI Announces HD Handle with new sizes and improved corrosion resistance

Park Hills, Missouri, July 9, 2015 — Bulk Tank Inc. (BTI), headquartered in Park Hills, Missouri, announced today an addition and upgrade to their HD Handle line.

Corrosion has been a long-standing problem with handles in the pneumatic tank trailer industry. BTI has made a big step in helping to reduce this problem with the newest version of their HD Handle. Replacing the trigger with a composite trigger they have stopped the corrosion build up between the trigger and the stainless steel pivot pin. This offers effortless operation while opening and closing the valve.

In addition to the corrosion resistant composite trigger, BTI now offers their HD Handle in a shorter Straight HD Handle version for 2", 3", and 4" airline valves for pneumatic tank trailers with tight locations. Both the long Curved HD and short Straight HD handles are available with a cathodic epoxy coating, which creates a virtually corrosive free environment. Both HD Handles also utilizes a stainless steel trigger tip, which significantly reduces wear and virtually eliminates breaking while skating the handle along the throttle plate.

The angled design of BTI's Curved HD Handle allows plenty of space between the valve and the operator's knuckles. The lengthened handle and ergonomically curved design provides more room for the operator to apply the leverage necessary to easily open or close any valve.

Even though the innovative design of BTI's HD Handles far exceeds any existing model, the cost compares with traditional handles. Driver friendly, competitively priced, and longer lasting - BTI once again raises the bar on an industry standard. As with all of its products, BTI unconditionally guarantees this handle will outperform any similar products on the market today.
